## 1. Model

Consider a sector of a centered circular domain with radius  $c$ . The oxide-metal interface is initially located at  $\|\mathbf{x}\| = b$ , and the steam-oxide interface is initially located at  $\|\mathbf{x}\| = a$ .

Two levelset functions are used to define the interfaces:

$$\phi_{\text{so}}(\mathbf{x}) = \|\mathbf{x}\| - a, \quad (1)$$

$$\phi_{\text{om}}(\mathbf{x}) = \|\mathbf{x}\| - b. \quad (2)$$

Interfaces and boundaries are defined as

$$\Gamma_{\text{so}} = \{\mathbf{x} \mid \phi_{\text{so}}(\mathbf{x}) = 0\}, \quad (3)$$

$$\Gamma_{\text{om}} = \{\mathbf{x} \mid \phi_{\text{om}}(\mathbf{x}) = 0\}, \quad (4)$$

$$\Gamma_{\text{mg}} = \{\mathbf{x} \mid \|\mathbf{x}\| = c\}, \quad (5)$$

$$\Gamma_{\text{bottom}} = \{\mathbf{x} \mid x_2 = 0\}, \quad (6)$$

$$\Gamma_{\text{left}} = \{\mathbf{x} \mid x_1 = 0\}, \quad (7)$$

Domains are partitioned as

$$\Omega = \Omega_{\text{s}} \cup \Omega_{\text{o}} \cup \Omega_{\text{m}}, \quad (8)$$

$$\Omega_{\text{s}} = \{\mathbf{x} \mid \phi_{\text{so}}(\mathbf{x}) < 0, \phi_{\text{om}}(\mathbf{x}) < 0\}, \quad (9)$$

$$\Omega_{\text{o}} = \{\mathbf{x} \mid \phi_{\text{so}}(\mathbf{x}) > 0, \phi_{\text{om}}(\mathbf{x}) < 0\}, \quad (10)$$

$$\Omega_{\text{m}} = \{\mathbf{x} \mid \phi_{\text{so}}(\mathbf{x}) > 0, \phi_{\text{om}}(\mathbf{x}) > 0\}. \quad (11)$$

Deformation is described by displacements  $\mathbf{u}$ , and heat conduction is described by temperature  $T$ , governed by

$$\nabla \cdot \boldsymbol{\sigma} = \mathbf{0}, \quad \forall \mathbf{x} \in \Omega_{\text{o}} \cup \Omega_{\text{m}}, \quad (12)$$

$$\int_{\Omega} \mathbf{n} \cdot \boldsymbol{\varepsilon} \mathbf{n} \, dV = 0, \quad \forall \mathbf{x} \in \Omega_{\text{o}} \cup \Omega_{\text{m}}, \quad (13)$$

$$\nabla \cdot \kappa \nabla T = 0, \quad \forall \mathbf{x} \in \Omega_{\text{o}} \cup \Omega_{\text{m}}. \quad (14)$$

---

*Email address:* [tianchen.hu@inl.gov](mailto:tianchen.hu@inl.gov) (Tianchen Hu)

where  $\mathbf{n}$  is the surface (boundary) normal,  $\kappa$  is the thermal conductivity, and  $\boldsymbol{\sigma}$  is the stress with constitutive relation to be defined, subject to constraints

$$\boldsymbol{\sigma}\mathbf{n} = -p\mathbf{n}, \quad \forall \mathbf{x} \in \Gamma_{\text{so}} \cup \Gamma_{\text{mg}}, \quad (15)$$

$$\kappa \nabla T \cdot \mathbf{n} = -h(T - T_\infty), \quad \forall \mathbf{x} \in \Gamma_{\text{so}} \cup \Gamma_{\text{mg}}, \quad (16)$$

$$\mathbf{u} \cdot \mathbf{n} = 0, \quad \forall \mathbf{x} \in \Gamma_{\text{bottom}} \cup \Gamma_{\text{left}}, \quad (17)$$

$$[[\mathbf{u}]] = \mathbf{0}, \quad \forall \mathbf{x} \in \Gamma_{\text{om}}, \quad (18)$$

$$[[T]] = 0, \quad \forall \mathbf{x} \in \Gamma_{\text{om}}. \quad (19)$$

where  $h$  is the heat convection coefficient,  $p$  is the pressure, and  $T_\infty$  is the environment temperature.

$\boldsymbol{\sigma}$  is defined as

$$\boldsymbol{\sigma} = \mathbb{C} : \boldsymbol{\varepsilon}_{\text{el}}, \quad (20)$$

where  $\mathbb{C}$  is the elasticity tensor. The total strain is updated based on an incremental scheme with polar decomposition [1], and is additively decomposed into

$$\boldsymbol{\varepsilon}_{\text{total}} = \boldsymbol{\varepsilon}_{\text{el}} + \boldsymbol{\varepsilon}_{\text{th}} + \boldsymbol{\varepsilon}_{\text{cr}} + \boldsymbol{\varepsilon}_{\text{ox}}, \quad (21)$$

where  $\boldsymbol{\varepsilon}_{\text{th}}$  is the thermal eigenstrain,  $\boldsymbol{\varepsilon}_{\text{cr}}$  is the effective creep strain, and  $\boldsymbol{\varepsilon}_{\text{ox}}$  is the accumulated strain due to oxidation.

The thermal eigenstrain is defined as

$$\boldsymbol{\varepsilon}_{\text{th}} = \int_{T_1}^{T_2} \alpha \, dT, \quad (22)$$

where  $\alpha$  is the instantaneous thermal expansion coefficient.

The creep strain follows a temperature dependent power law:

$$\dot{\boldsymbol{\varepsilon}}_{\text{cr}} = A(\sigma_{\text{vm}})^n \exp\left(-\frac{Q}{RT}\right), \quad (23)$$

where  $A$  is the creep rate coefficient,  $\sigma_{\text{vm}}$  is the Von Mises stress,  $Q$  is the creep activation energy,  $R$  is the ideal gas constant.

Following [2], the oxide growth strain is decomposed into intrinsic growth strain and geometric growth strain:

$$\boldsymbol{\varepsilon}_{\text{ox}} = \boldsymbol{\varepsilon}_{\text{ox}}^{\text{intr}} + \boldsymbol{\varepsilon}_{\text{ox}}^{\text{geo}}. \quad (24)$$

The intrinsic growth strain is given as  $\boldsymbol{\varepsilon}_{\text{ox},\theta}^{\text{intr}} = \boldsymbol{\varepsilon}_{\text{ox},z}^{\text{intr}} = \tau/B$ ,  $\boldsymbol{\varepsilon}_{\text{ox},r}^{\text{intr}} = 0$ , where  $\tau = \sqrt{2A_{\text{ox}} \exp(-\frac{Q_{\text{ox}}}{RT})t}$  is the oxide thickness. The geometric growth strain is given as  $\boldsymbol{\varepsilon}_{\text{ox},r}^{\text{geo}} = \boldsymbol{\varepsilon}_{\text{ox},z}^{\text{geo}} = 0$ ,  $\boldsymbol{\varepsilon}_{\text{ox},\theta}^{\text{geo}} = -\ln(r_c/r_0)$ , where  $r_c$  is the current radial coordinate and  $r_0$  is the initial radial coordinate where the oxide is formed.

All model parameters and material properties are summarized in the appendix.

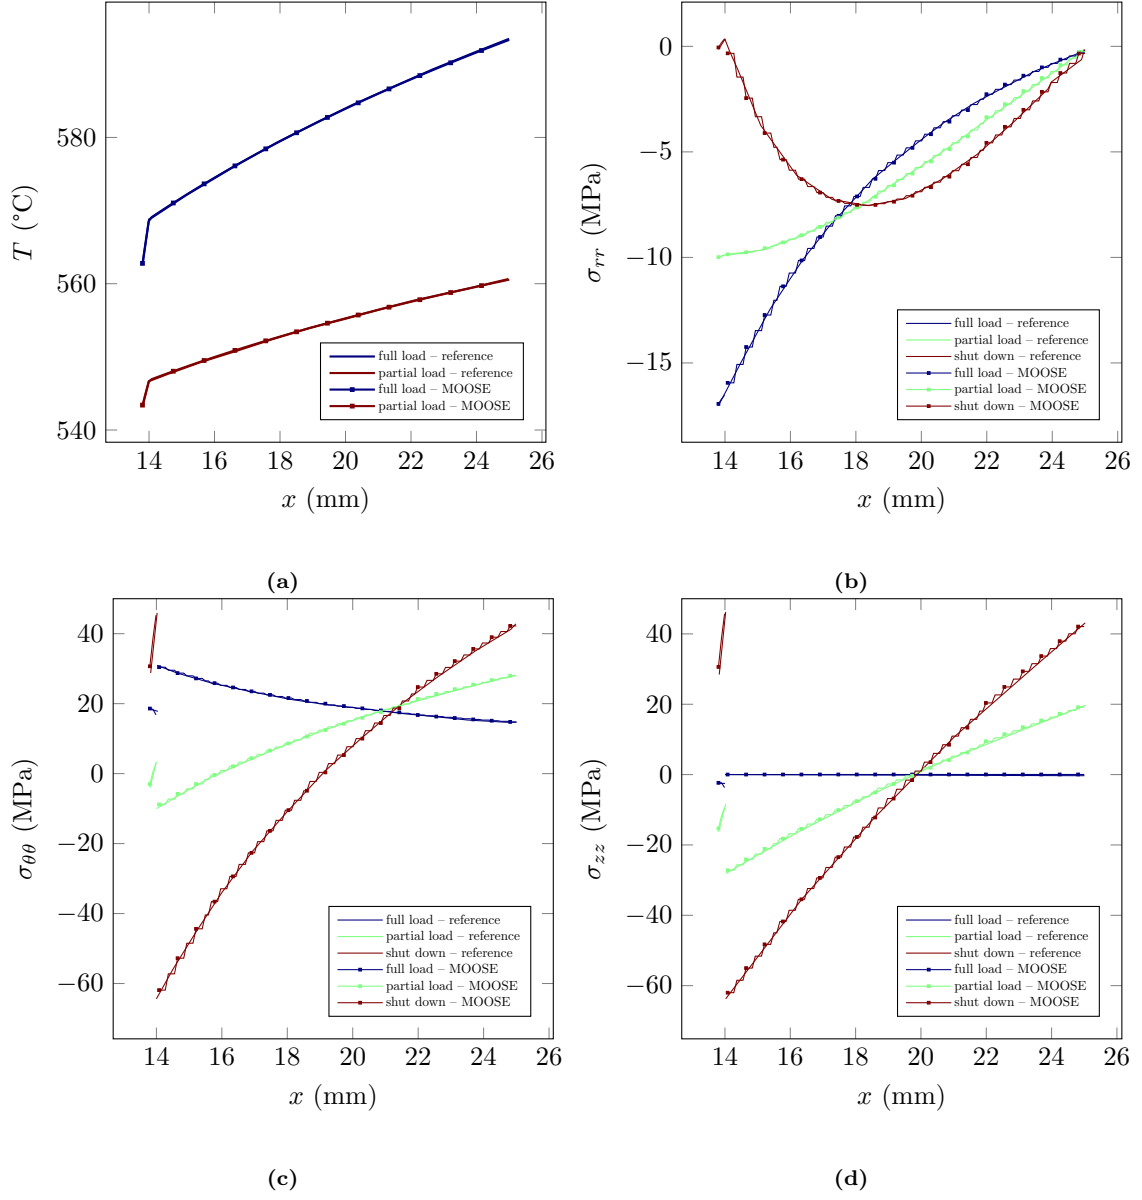

## 2. Benchmark

## 3. Creep strain

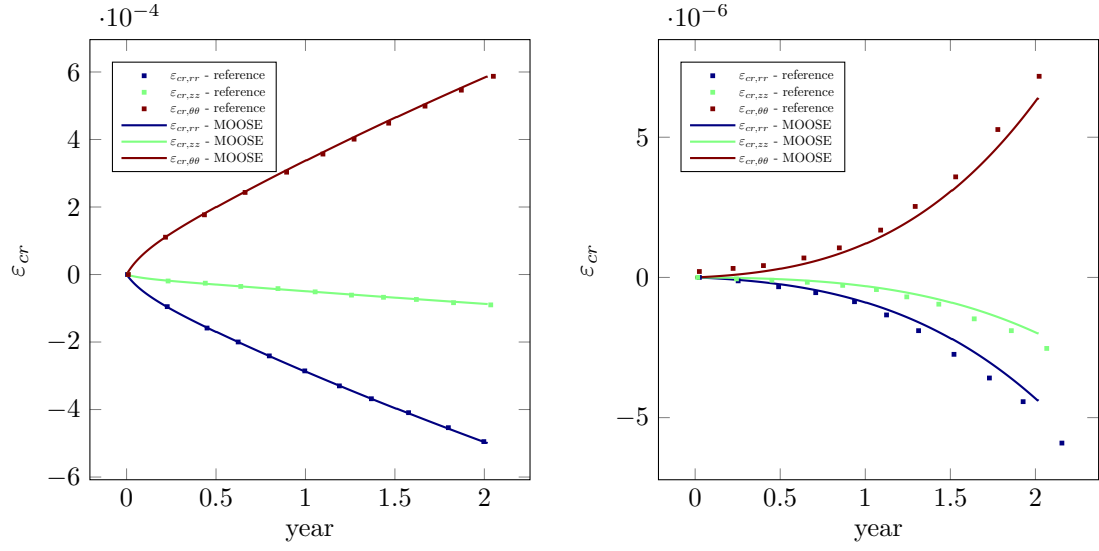

## 4. LAROMANCE

**Figure 1.** Comparison among the analytical solution, the numerical solution from [2], and the numerical solution obtained using MOOSE for (a) radial stress, (b) hoop stress and (c) axial stress.

**Figure 2.** Comparison between the numerical solution from [2] and the numerical solution obtained using MOOSE for (a) temperature, (b) radial stress, (c) hoop stress and (d) axial stress at different load profiles.

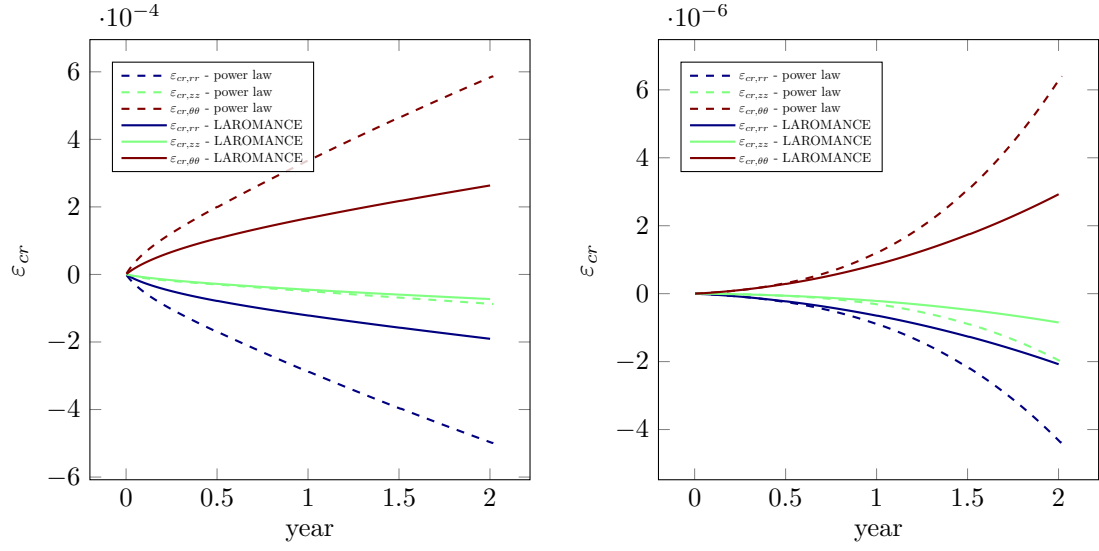

(a)  $\epsilon_{cr}$  in the metal near the oxide-metal interface

(b)  $\epsilon_{cr}$  in the oxide at the middle of the oxide

(c)  $\sigma$  at the middle of the oxide

## Appendix A Model parameters and material properties

**Table A.1.** Summary of material properties and model parameters for metal

Property/Parameter	Symbol	Value	Unit
Outer radius	$c$	25	mm
Thickness	$\tau$	11	mm
Young's modulus	$E$	190	GPa
Poisson's ratio	$\nu$	0.3	nondim.
Thermal conductivity	$\kappa$	30	$\text{W m}^{-1} \text{K}^{-1}$
Convection coefficient (metal-gas)	$h$	100	$\text{W m}^{-2} \text{K}^{-1}$
Creep coefficient	$A$	$2.3 \times 10^6$	$\text{s}^{-1}$
Creep exponent	$n$	5.06	nondim.
Creep activation energy	$Q$	400	$\text{kJ mol}^{-1}$

**Table A.2.** Summary of material properties and model parameters for oxide

Property/Parameter	Symbol	Value	Unit
Young's modulus	$E$	120	GPa
Poisson's ratio	$\nu$	0.24	nondim.
Thermal conductivity	$\kappa$	3	$\text{W m}^{-1} \text{K}^{-1}$
Convection coefficient (steam-oxide)	$h$	2800	$\text{W m}^{-2} \text{K}^{-1}$
Creep coefficient	$A$	$8.5875 \times 10^7$	$\text{s}^{-1}$
Creep exponent	$n$	3	nondim.
Creep activation energy	$Q$	421.62	$\text{kJ mol}^{-1}$
Growth strain scale factor	$B$	0.3	m
Oxidation coefficient	$A_{\text{ox}}$	$6.22 \times 10^8$	$\text{m}^2 \text{h}^{-1}$
Oxidation activation energy	$Q_{\text{ox}}$	326	$\text{kJ mol}^{-1}$

**Table A.3.** Summary of operation schedule

Load	Duration (h)	$T_s$ ( $^{\circ}\text{C}$ )	$T_g$ ( $^{\circ}\text{C}$ )	$p_s$ (MPa)	$p_g$ (MPa)	Transition (h)
Full	14	530	1100	17	0.2	Full to Partial: 1
Partial	8	525	845	10	0.1	Partial to Full: 1
Shutdown	25	25	25	0.1	0.1	Full to Shutdown: 6 Shutdown to Full: 3

**Figure A.5.** instantaneous thermal expansion coefficients for oxide and metal.

**Figure A.6.** Example schedule: five full – partial cycles followed by a shutdown.
